Week-5

5) Design a process for recording basic, desktop, web.

Open UI path

select - go to design - App/web recorder
if it doesnt show first open Use Application/browser from utilities

→ Then start Applweb Recorder
→ before starting it only open a notepad
→ after starting it select the text area in notepad.
→ give what to be present in that and confirm
And save and return to the UI path

Desktop

→ get Use application / browser into the sequence
→ select Indicate application to automate (1)
→ Select the first page of desktop screen.
→ In Do
add a click activity - select any folder (double click)
→ add one more click - select any file (select the whole file)
→ Run debug

web.

→ New sequence (add extension)

→ Use application/browser → open and select browser

→ Do - click → Gmail
activity

→ Then it opens the Gmail
Select click activity and [Sign Up] button

→ next Type Into activity
select the username bar and type your email-ID in string format with double quote

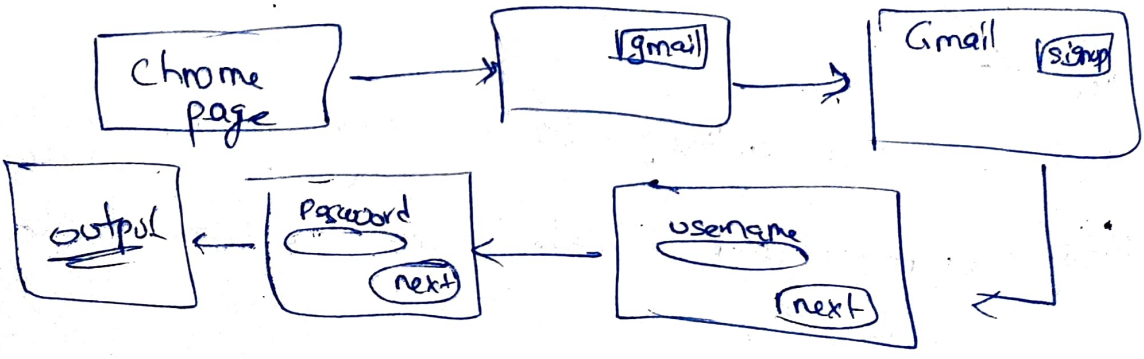
→ Click activity [next]

→ next one again Type Into for password

→ Type password in string format

→ And select [Confirm] button by click activity

It opens the Gmail page and that concludes the automation



Experiment - 6

⇒ Designing a process for scraping data using screen scraping and data scraping.

data scraping -

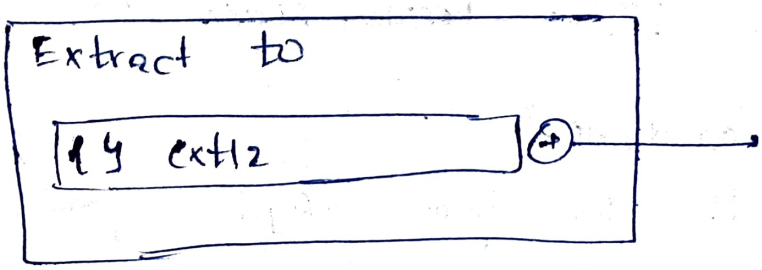
⇒ Open UI path - select activity Use Application/ browser

⇒ Go to chrome and search for amazon iphones It will showcase all the phones from different vendors (choose a layout with all phones).

⇒ In the Indicate application to automate (1)
↓
select the chrome page

↳ Do
In this select activity Extract table data
here we will get a pop up to select the Columns to scrape data

→ particularly select name of product → confirm
→ Select data to extract → price only → confirm
→ Save & close the pop



select "Write Range workbook activity

{} "data scr.xls"

{} "Sheet1"

{} ext12

This will store the columns we scraped into data scr.xls.

→ In projects - select folder and open the sheet

Screen scraping

→ Go to chrome open wikipedia homepage

→ New sequence → use application / browser

Indicate application → select wikipedia

↳ Do

• Type Into INPUT searchInput(1)

Select the search box in wikipedea

Type this

"India"

. Click activity beside search box

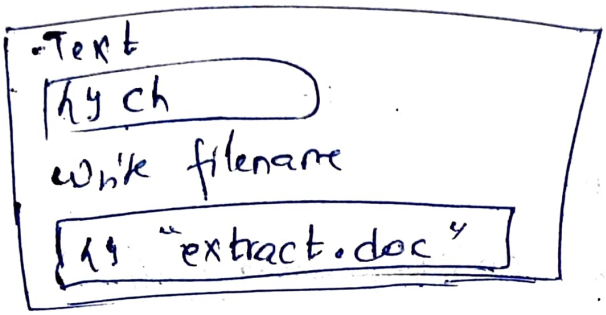
Get Text "Coordinates"

→ here slet the box from wikipedia from which you want to extract data

Save to

hych → create new variable

Write Text file: activity to save the scrapped



Go to projects and folder extract.doc is visible with the extracted scrapped data from wiki

Extra part

→ to save in drive

select account, Upload file activity

→ same name or path of file.

→ select destination & create a new variable

Experiment-8

- Aim:

Create a process for image and text automation

Create a process

Use application/browser

→ select any page - ex- cmrit.hyderabad.edu.in

→ Next use activity 'get OCR' → select any on that page

→ Here go to properties create a variable - 'img'

→ Then we need api key to perform this.

→ Goto 'cloud.uipath.com'.

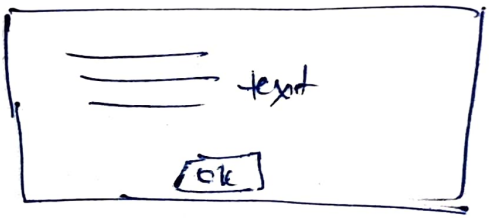
On left panel go to admin → consumables

copy the API key from here and paste it in properties of 'get OCR' activity

→ Install .Net if not installed.

→ Run/debug after creating a message box with 'use variable' → img

This prints the text inside an image



Experiment 11

→ Create a folder on desktop

→ Add some examples of PDF's in this folder

→ Open UI path and do as follows

Create Activity - "For each file in folder"

for each current file in folder - file path

filter by - "*.pdf"

order by - Name ascending first

by this all files in folder will be kept in a loop

Do activity

Message Box - Current File.FullName

Extract PDF text - Load Resource → select file path

↓

In properties
Add new variable
ctrl + k

here one should select first file on the folder to maintain Ascending order of files which extracts all files one by one

Add a message box with same variable name

Yes

→ Write Text file - activity

→ Text - to datapdf and filename to save

→ This will be saved in the projects

→ Now it will run the process one by one extracting the PDF's and stores into a new file
